AI Development Residency Week 3 Submission

Links

1. **GitHub Repository:** https://github.com/domcbradley-gif/AI-Development-Residency (Week 3 work is in the `Week3/` folder)
2. **Hosted app:** *Not publicly hosted yet.* The app runs locally via Docker at `http://localhost:5173` (and the API at `http://localhost:8000/docs`). Per the build plan, public deployment to a free host was deliberately deferred to a later slice — this phase is local-only.

Documents

1. **Notion links:**

    - MVP #1 Backlog board: https://app.notion.com/p/c2317f1088604a6e964ffe73d43f987c
2. **Other document links:** *(optional)* your “Dev Setup Notes” doc: https://claude.ai/artifact/1UdvSusR2kFrULyzwoyj4P

What You Did

- Installed Python, VS Code, git, cloned the repo, Docker
- Local Postgres in Docker, Vite + React + Material UI. Deployed local-only. Set up to receive anonymous information
- Built three tiers - a front-end form, a FastAPI backend, a Postgres database - in the `Week3/` folder
- Confirmed it worked because tests were being passed, `docker compose up`, submitting an anonymous note and seeing it come back
- Baked in safety rules include anonymous by default, synthetic-data only at this stage, provisional config on community-owned decisions

What You Learned

- What clicked for me going from zero coding to a running app was that Claude Code could give me choices to pick from, the same way chatting in Claude Desktop does.
- What tripped me up was installing Docker. They had two download versions, and the install then needed extra Windows pieces turned on before it would run. However, Claude kept guiding me to submit screenshots of what I was seeing so that it could help. Despite that hiccup, the process was much shorter than I expected.
- What I would do differently is start with my folder outside of OneDrive. I learned that leaving it there could make it vulnerable to changes that would impact the build. But as a non-coder, I think I did a pretty good job with my homework.
- Planning before building, documenting along the way, and verifying the work will help me on team projects later. People often talk about establishing a single source of truth, and I definitely have seen projects go off the rails in the absence of those practices.
